

ABSTRACT

Immunizing is way of to increase the somebody impenetrability actively to antigen, so that the disease, principal forming of similar antigen is not happened by the disease, principal forming of antibody in body of early from entry of anigen into body. With entry of antigen into body will race antigen imunologik (immunology memory) body to make antibody is so that happened by mechanism proteksi body and will tie to infection.

This research aim to for memperelajari relation of between mother status work with regularity immunize hepatitis B of at Balita in Posyandu Countryside Waung Kec. Krembung.

this Research Type use analytic research method by desain is type cross sectional research. Population in this research is mother owning Balita. Big of sampel in this research as much 47 responder. While sampling used by is *probability sampling* technicsly is *simple random sampling* (random simtem of random). Variable checked by that is mother status work as independent variable and the regularity immunize hepaititi B as variable dependen. Data gathered to be processed by using test *chi-square* $\alpha = 0,05$.

Result test chi-square show value χ^2 counting 4,02 and χ^2 tables = 3,84. Because χ^2 counting $>$ χ^2 tables hence H_1 accepted by its meaning there is relation of between mother status work with regularity immunize hepatitis B of at Balita.

Pursuant to above research concluded by that mother status work very influence with regularity immunize hepatitis B. More and more laboring mother smaller opportunity balita to get hepatitis B regularly. immunizedly is regular hepatitis B of baby will get effective impenetrability because its important is this matter hence strive taken is conducted is counselling and give information matching with the mother knowledge, in order to easy to comprehend about its important is gift regularity immunize at baby.

Keyword : Ms. working, Regularity immunize.
